Presenter: No conflicts to declare and no tobacco-related funding sources over the last 10 years for any research

# My Journey into Tobacco Research

What does 'choice' mean when it comes to health?

---

Cardiovascular disease (CVD) causes 31% of deaths worldwide (1)

---

17% of people in Europe are living with CVD (2).

---

Tobacco is a key risk factor—and quitting can prevent both first-time and repeat cardiac events (3-4).

# 8000 people with CVD event

26% were  
smoking at  
diagnosis

Six months  
later 61%  
still  
smoking

Majority  
prescribed  
ACE  
inhibitors,  
statins and  
beta-  
blockers

19%  
advised to  
attend a  
stop  
smoking  
clinic

20% of  
those who  
attended  
were  
offered  
medication

1 in 8 people live with mental illness in the world (6).

People with serious mental illness die 15–20 years younger, mostly from preventable physical illnesses (7).

Smoking is the leading contributor for these preventable physical illnesses (8).

Inequalities?

UK general smoking rate: 46% (1970s) → 12.9% (2022) (9).

Smoking rates have not decreased for people living with mental illness in UK(10).

Up to 85% of people with schizophrenia smoke (11).

Many use smoking to cope with stress with ~40% believe it relieves stress (12,13).

Common in both psychiatric and general populations (14,15).

Fear of mental health decline deters quitting and clinicians may hesitate to recommend smoking cessation (16,17).

BUT quitting associated with improved mental health (18,19).

[Intervention Review]

## **Smoking cessation for secondary prevention of cardiovascular disease**

Angela Difeng Wu<sup>1</sup>, Nicola Lindson<sup>1</sup>, Jamie Hartmann-Boyce<sup>1</sup>, Azizia Wahedi<sup>2</sup>, Anisa Hajizadeh<sup>1</sup>, Annika Theodoulou<sup>1</sup>, Elizabeth T Thomas<sup>1</sup>, Charlotte Lee<sup>1</sup>, Paul Aveyard<sup>1</sup>

## Risk Reduction for secondary CVD events →

### Authors' conclusions

#### Implications for practice

- People with heart disease who smoke, and their clinicians, can be reassured that stopping smoking is associated with a decreased risk of secondary cardiovascular disease (CVD) outcomes, including CVD, major adverse cardiovascular events (MACE), all-cause mortality, non-fatal myocardial infarction, non-fatal stroke and new-onset angina.
- People with heart disease who smoke, and their clinicians, can be reassured that smoking cessation will not worsen, and may improve quality of life.

#### Implications for research

- Further studies that examine the impact of smoking cessation while controlling for secondary CVD prevention medication and severity of initial coronary heart disease (CHD) event, as well as other listed confounding factors, would strengthen the evidence on the impact of smoking cessation.
- Research investigating the severity of the initial CHD event, as well as intensity of smoking prior to cessation, may strengthen the evidence on magnitude and speed of smoking cessation impact.
- Studies should also consider investigating the impact of combined benefit of smoking cessation and secondary prevention medication.
- Future studies should also stratify results by sex, where feasible, as the majority of studies in this review were predominately focused on men.
- Additional, larger studies that examine the impact of smoking cessation on CVD would also strengthen the evidence as the smaller studies included in the review may be exaggerating the benefits of cessation.
- A systematic review of intervention studies supporting smoking cessation in people with established cardiac disease would strengthen the evidence of causality. Individual trials are likely to be too small to show benefits, but pooling can improve statistical power to reveal the health impact.

## Smoking Cessation and Changes in Anxiety and Depression in Adults With and Without Psychiatric Disorders

Angela Difeng Wu, MSc; Min Gao, PhD; Paul Aveyard, PhD; Gemma Taylor, PhD

# Results and Implications

**Table 2. Hospital Anxiety and Depression Scale Scores for Participants by Smoking Status and Unadjusted Complete Case Tobit Regression**

Outcome and time	Score, mean (SD)
<b>Anxiety<sup>a</sup></b>	
Continued smoking	
Baseline	4.31 (3.67)
Follow-up	2.29 (3.43)
Stopped smoking	
Baseline	3.81 (3.43)
Follow-up	1.51 (2.79)
<b>Depression<sup>b</sup></b>	
Continued smoking	
Baseline	2.51 (2.92)
Follow-up	1.67 (2.77)
Stopped smoking	
Baseline	2.21 (2.81)
Follow-up	0.92 (2.10)

<sup>a</sup>  $\beta = -0.28$  (95% CI, -0.41 to -0.14).

<sup>b</sup>  $\beta = -0.29$  (95% CI, -0.4 to -0.19).

**Table 3. Change in Hospital Depression and Anxiety Scale Scores for People Who Remained Abstinent Between Weeks 9 and 24**

Outcome	$\beta$ (95% CI)
<b>Depression</b>	
Tobit complete adjusted	-0.47 (-0.61 to -0.33)
PSM Tobit adjusted	-0.42 (-0.6 to -0.24)
Tobit removal of bupropion	-0.37 (-0.53 to -0.21)
Tobit without psychiatric history	-0.32 (-0.48 to -0.15)
Tobit with psychiatric history	-0.60 (-0.82 to -0.38)
Multiple imputation Tobit	-0.97 (-1.15 to -0.78)
Multiple imputation PSM	-0.53 (-0.67 to -0.4)
<b>Anxiety</b>	
Tobit complete adjusted	-0.40 (-0.58 to -0.22)
PSM Tobit adjusted	-0.32 (-0.53 to -0.11)
Tobit removal of bupropion	-0.33 (-0.53 to -0.12)
Tobit without psychiatric history	-0.29 (-0.50 to -0.80)
Tobit with psychiatric history	-0.48 (-0.76 to -0.20)
Multiple imputation Tobit	-0.33 (-0.53 to -0.12)
Multiple imputation PSM	-0.54 (-0.7 to -0.37)

Abbreviation: PSM, propensity score matching.

## Why Focus on Smoking Cessation in CVD and Mental Illness?

Initial studies **highlighted smoking cessation** as a key intervention to improve outcomes for people with **cardiovascular disease (CVD)** and **mental illness**

These findings led to **two PhD projects** exploring:

What is currently being offered by **GPs** for smoking cessation

**How we can incentivise** more effective interventions in practice

# The Role of Financial Incentives (Quality of Outcomes Framework)

- GPs are incentivised to:
  - Record smoking status
  - Provide advice/support
- System rewards advice to quit the same as providing treatment
  - despite differences in effectiveness (20).
- Overuse of advice codes; underuse of effective interventions in general population with minimal change in smoking abstinence rates (21).

# Objectives and Methods

- Measure frequency/types of cessation support in heart disease patients
- Compare support and success rates in patients with vs. without mental illness
- Source: Electronic GP records
- Participants: Adults with incident heart disease (1996–2019)

# Investigating the association between recorded smoking cessation interventions and smoking cessation in people living with cardiovascular disease using UK general practice data

Research | [Open access](#) | Published: 01 May 2025

Volume 26, article number 141, (2025) [Cite this article](#)

People who receive intervention are more likely to quit **HOWEVER** most widely used intervention is least effective for smoking cessation

System-level incentives like QOF may need reform to reward quality, not just presence of “support”

# Doctor Attitude towards Smoking

- UK guidance frames smoking as a dependency needing treatment (22).
- Beliefs about patient responsibility affect likelihood to offer support (23).
- Clinicians less likely to intervene if they feel the patient is “choosing” to smoke (24).

**People must take more responsibility for their own health, says health secretary Matt Hancock**

Agency

Awareness

# Research Question

Does responsibility framing influence a GP's likelihood of offering evidence-based cessation support?

What attitudes do UK doctors have regarding smoking and health?

Participants:

GPs, students, doctors

Setting:

Between-subjects online study

## Professional Obligation

**OxPrimaryCareSci**  
@OxPrimaryCare

Newest research reaffirms that the most effective way to help people [#stopsmoking](#) is through behavioural support and/or medication. GP failure to provide a patient with smoking cessation support is a failure to meet professional obligations.

## Attitude Statements

# Implications

## Oxford Tobacco Addiction Group (OXTAG)

Our group produces primary research and systematic reviews of the evidence on interventions to prevent and treat tobacco addiction. This includes interventions for smoking cessation, for preventing smoking uptake, and public policy interventions for reducing smoking prevalence.

### WHO WE ARE

We are a group of researchers and doctoral students based within the **Centre for Evidence-Based Medicine** and the **Interdisciplinary Research in Health Sciences team** at the **Nuffield Department of Primary Care Health Sciences**, chaired by **Dr Nicola Lindson**. We work together to produce research that reduces the burden of tobacco use and smoking-related disease.
